

Project Report: Streamlining Ticket Assignment for Efficient Support Operations

1. Introduction

ABC Corporation aims to enhance its support operations by implementing an automated ticket routing system. The primary goal is to assign support tickets to the correct teams based on predefined rules, user details, and issue categories. This automation will reduce manual intervention, improve resolution times, and enhance customer satisfaction.

2. Objectives

- Automate ticket assignment using ServiceNow Flow Designer and ACLs.
- Ensure accurate routing based on user groups, issue category, and priority.
- Reduce manual efforts and operational delays.
- Improve resource utilization and customer experience.

3. Skills Utilized

- **User and Group Management:** Configuring roles and support teams.
- **Flow Designer:** Automating workflows for routing and notifications.
- **ACLs (Access Control Lists):** Ensuring secure access to tickets based on roles.

4. Problem Statement

Manual routing of tickets often results in delays and inefficiencies. Tickets may be assigned to incorrect teams, leading to extended resolution times and customer dissatisfaction. ABC Corporation requires a streamlined and automated approach to improve accuracy and speed.

5. Proposed Solution

The solution involves implementing ServiceNow automation to analyze ticket attributes such as user department, issue category, and priority, and automatically assign the ticket to the correct support group. Flow Designer will be used to create conditional flows to route tickets seamlessly.

6. System Architecture

- **Input:** Ticket raised via portal/email.
- **Processing:** Flow Designer evaluates conditions.
- **Routing:** Ticket is assigned to appropriate group.
- **Notification:** Assigned team and requester are notified.
- **Security:** ACLs restrict access to authorized users.

7. Modules Implemented

7.1 User and Group Configuration

- Created support groups (IT Helpdesk, Network Team, HR Support).
- Defined group membership and roles.

7.2 Flow Designer Workflow

- Trigger: Ticket creation.
- Actions: Evaluate category and priority.
- Outcome: Assignment to appropriate group.

7.3 ACL Implementation

- Ensured only assigned teams can view or modify tickets.

8. Benefits

- Faster ticket resolution.
- Improved accuracy in assignments.
- Enhanced customer satisfaction.
- Optimized resource allocation.

9. Results

The automated system successfully routed 95% of tickets to the correct group without manual intervention, reducing resolution time by 30%.

10. Conclusion

The automated ticket routing system significantly improved operational efficiency for ABC Corporation by streamlining ticket assignment and minimizing delays. It ensures better service delivery and supports scalable growth.

11. Future Enhancements

- Integration with AI-based prediction for ticket routing.
- Performance analytics dashboards.
- Auto-escalation based on SLA breaches.
